13. Other:							
FRIMARX FY ARABATA							
(

Continuation of 11. does NOT place the application in condition for allowance because:

Applicant is arguing that the Examiner has rejected each device by referring to the same portions of the Liu patent although the system includes three distinct devices with separate functionalities and requests further explanation of the Examiner's interpretation of the reference

In reply, the Examiner states that although there are three seprate devices in the system, these devices are used in the same system and communicate with each other in a similar manner. For example, in claim 46, in which the applicant is claiming the data transmission device, the claim states that the data transmission device comprises a transmission unit for transmitting a signal to a portable terminal to obtain device information from the data receiving device in order to establish a communication with the data receiving device. In claim 51, in which the applicant is claiming a data receiving device, the claims states that the data receiving device comprises a transmission unit for transmitting device information to said portable terminal according to a request from said portable terminal where in the device information is used to establish a connection with the data transmission device. In claim 58, the applicant is claiming the portable terminal, the claims states that the portable terminal comprises a transmission unit for transmitting to a data receiving device a signal to request device information from a data transmission device for establishing a connection between said data transmission device and said data receiving device. In each of the preceeding claims, the same system is being claimed, therefore the functionality of each device in the system is the same. The Examiner has used the same citations in the Liu patent to reject all three of the devices due to this reason. The Liu patent teaches this claimed system. Examiner points to column 2, lines 57-59 and column 1, lines 34-47 as an example. Here, Liu teaches that a remote discovery node (portable terminal) is capable of discovering devices (data receiving devices) on demand from another device (data transmission device) in order to obtain conneciton information such as IP address/MAC address (device information) to enable communication between the devices. Rejection is maintained.
